Aliphatic compound, any chemical compound belonging to the organic class in which the atoms are connected by single, double, or triple bonds to form nonaromatic structures. One of the major structural groups of organic molecules, the aliphatic compounds include the alkanes, alkenes, and alkynes and substances derived from them—actually or in ...

An aliphatic compound is a hydrocarbon compound containing carbon and hydrogen joined together in straight chains, branched trains or non-aromatic rings. Aliphatic compounds may be saturated (e.g., hexane and other alkanes) or unsaturated (e.g., hexene and other alkenes, as well as alkynes). The simplest aliphatic hydrocarbon is methane, CH₄.

In organic chemistry, hydrocarbons (compounds composed solely of carbon and hydrogen) are divided into two classes: aromatic compounds and aliphatic compounds (/ , æ l i ' f æ t i k /; G. aleiphar, fat, oil), also known as non-aromatic hydrocarbons. Aliphatics can be cyclic; however, hydrocarbons with conjugated pi-systems that obey Hückel's rule are instead considered to demonstrate ...

However, new methods for the synthesis of all classes of aliphatic nitriles are covered. The review has the same format as COFGT (1995), with general methods for the synthesis of nitriles being covered first, followed by methods that are specific for nitriles containing particular additional functional groups.
